Introduction

Structure Of Hands-On Lab

- Three short lectures, each followed by a short lab
 - https://github.com/kabutz/DeadlockLabECESCON9
 - (or http://tinyurl.com/deadlocks2016)
- Fourth lab if we have time

Questions • Please please please please ask questions! Interrupt us at any time This lab is on deadlocks, we need to keep focused in available time The only stupid questions are those you do not ask Once you've asked them, they are not stupid anymore The more you ask, the more we all learn

Avoiding Liveness Hazards

Avoiding Liveness Hazards Fixing safety problems can cause liveness problems Don't indiscriminately sprinkle "synchronized" into your code

Deadly Embrace

- Lock-ordering deadlocks
 - Typically when you lock two locks in different orders
 - Requires global analysis to make sure your order is consistent
 - Lesson: only ever hold a single lock per thread!

Thread Deadlocks in BLOCKED

- A deadly embrace amongst synchronized leaves no way of recovery
 - We have to restart the JVM

Resource Deadlocks

This can happen with bounded queues or similar mechanisms meant to bound resource consumption

Lab 1: Deadlock **Resolution by Global** Ordering

Lab 1: Deadlock Resolution By Global Ordering

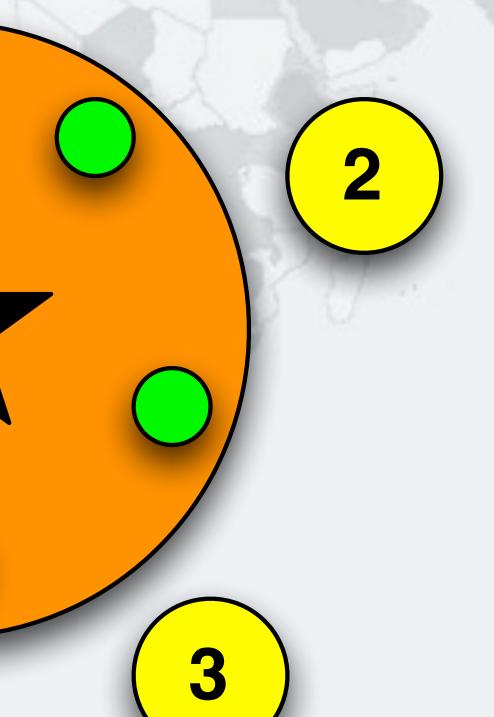

- Classic problem is that of the "dining philosophers"
 - We changed that to the "drinking philosophers"
 - That is where the word "symposium" comes from
 - sym together, such as "symphony"
 - poto drink
- Ancient Greek philosophers used to get together to drink & think In our example, a philosopher needs two glasses to drink - First he takes the right one, then the left one
- - When he finishes drinking, he returns them and carries on thinking

Our Drinking Philosophers

- Our philosopher needs two glasses to drink
 - First he takes the right one, then the left one
 - When he's done, he returns the left and then the right returns them and carries on thinking

Table Is Ready, All Philosophers Are Thinking

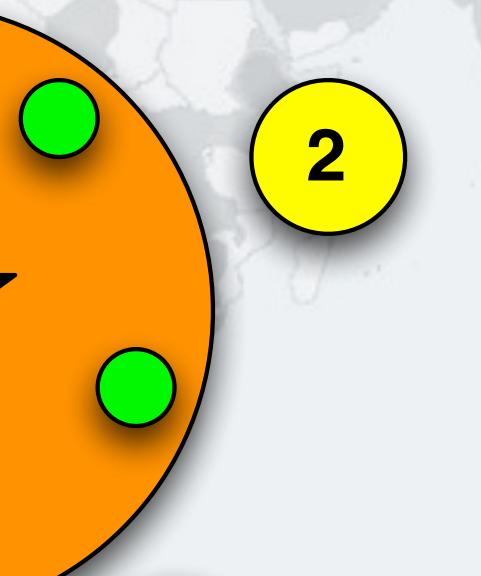

5

5

4

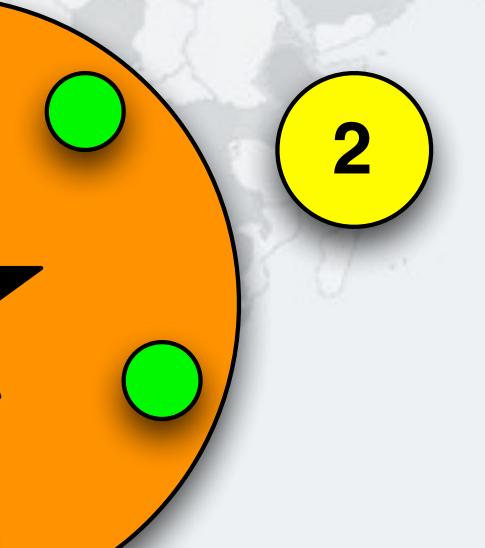

Philosopher 5 Wants To Drink, Takes **Right Cup**

5

4

Philosopher 5 Is Now Drinking With Both Cups

Philosopher 3 Wants To Drink, Takes Right Cup

5

4

17

 \odot

Philosopher 3 Is Now Drinking With Both Cups

5

4

 \odot

4

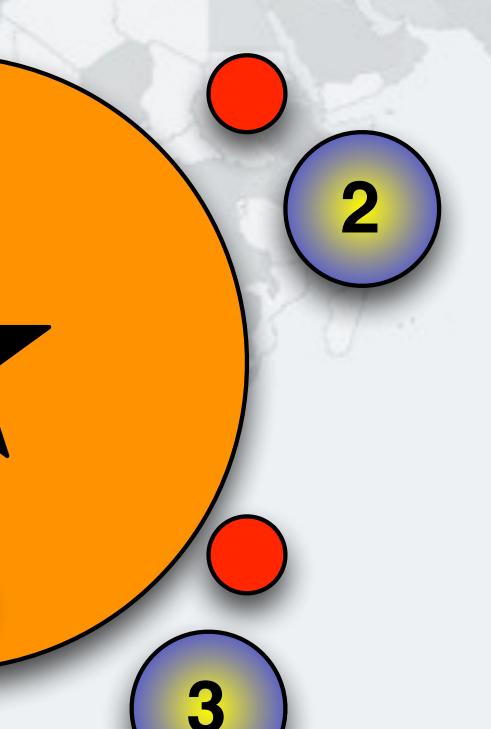

Philosopher 2 Wants To Drink, Takes **Right Cup** But he has to wait for Philosopher 3 to finish his drinking 5 2 session

5

4

Philosopher 3 Finished Drinking, Returns Left Cup

Philosopher 3 Returns Right Cup

5

2

3

Philosopher 2 Is Now Drinking With Both Cups

5

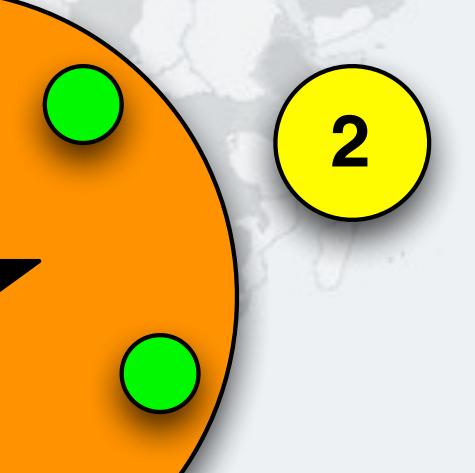

Drinking Philosophers In Limbo

- The standard rule is that every philosopher first picks up the right cup, then the left If all of the philosophers want to drink and they all pick up the right cup, then they all are holding one cup but cannot
 - get the left cup

A Deadlock Can Easily Happen With This Design

5

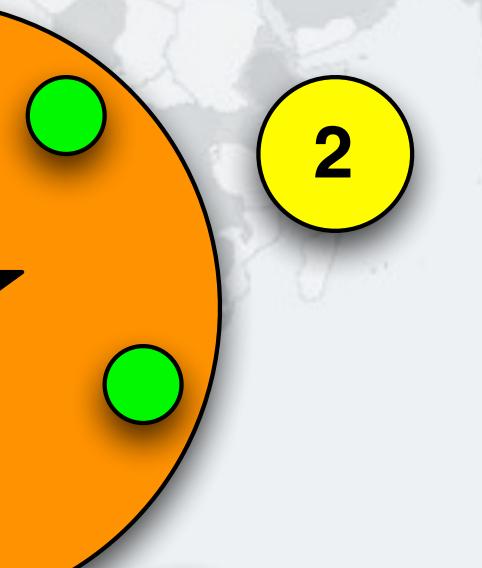

4

5

4

Philosopher 5 Wants To Drink, Takes **Right Cup**

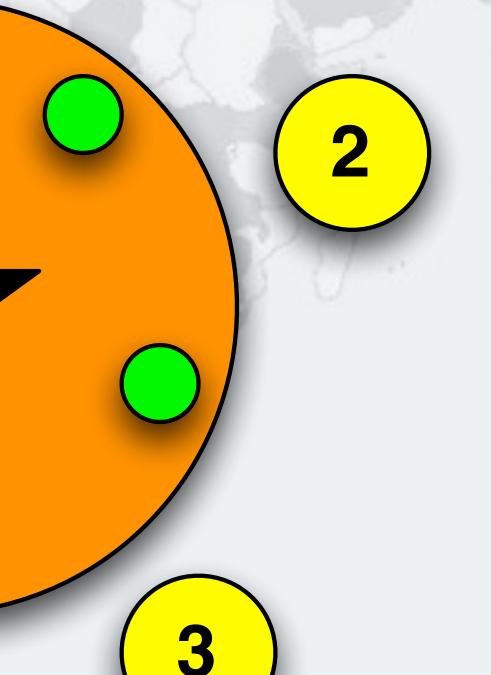

3

 \odot

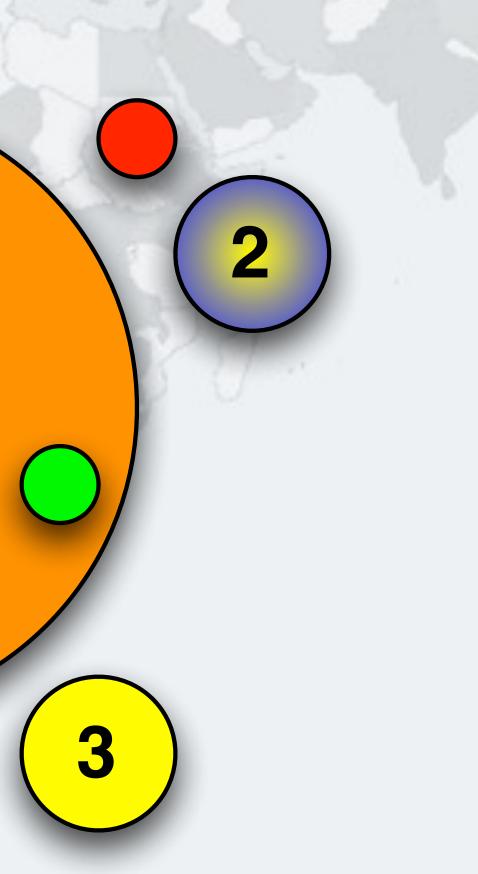

Philosopher 1 Wants To Drink, Takes Right Cup

5

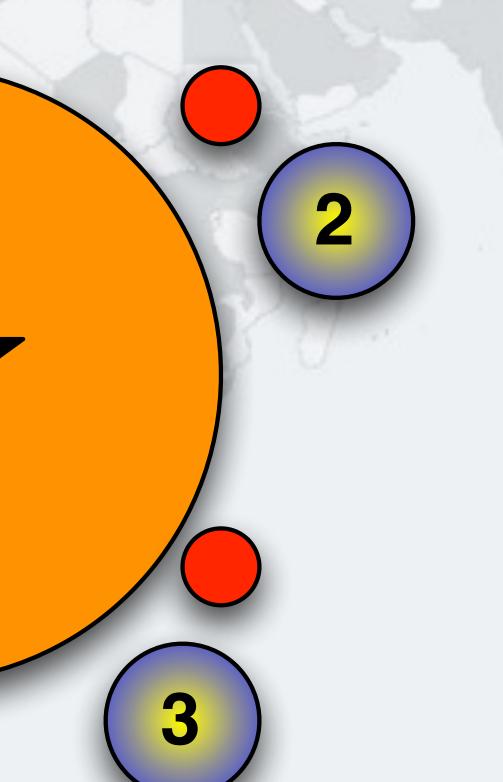

Philosopher 2 Wants To Drink, Takes Right Cup

5

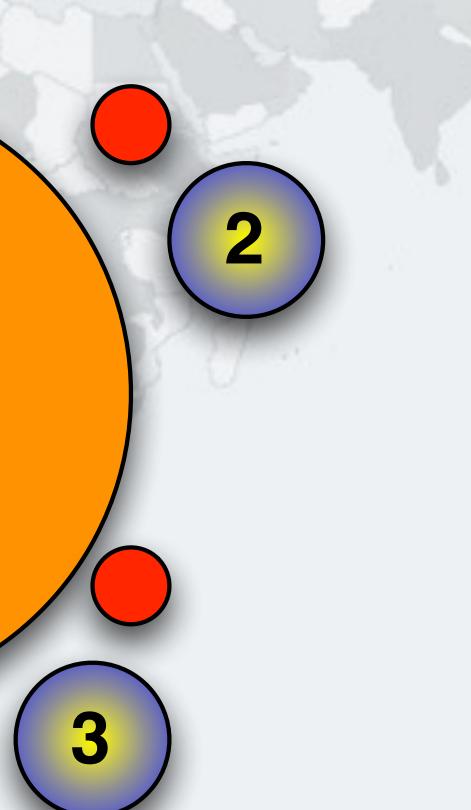

Philosopher 3 Wants To Drink, Takes Right Cup

5

Philosopher 4 Wants To Drink, Takes Right Cup

5

2

3

Deadlock!

All the philosophers are waiting for their left cups, but they 5 will never become available

Global Order With Boozing Philosophers

If all philosophers hold one cup, we deadlock In our solution, we have to prevent that from happening

Fixed Order Of Lock Acquisition

- We can solve the deadlock with the "dining philosophers" by requiring that locks are always acquired in a set order
 - For example, we can make a rule that philosophers always first take the cup with the largest number If it is not available, we block until it becomes available
 - And return the cup with the lowest number first

Global Lock Ordering

5

5

4

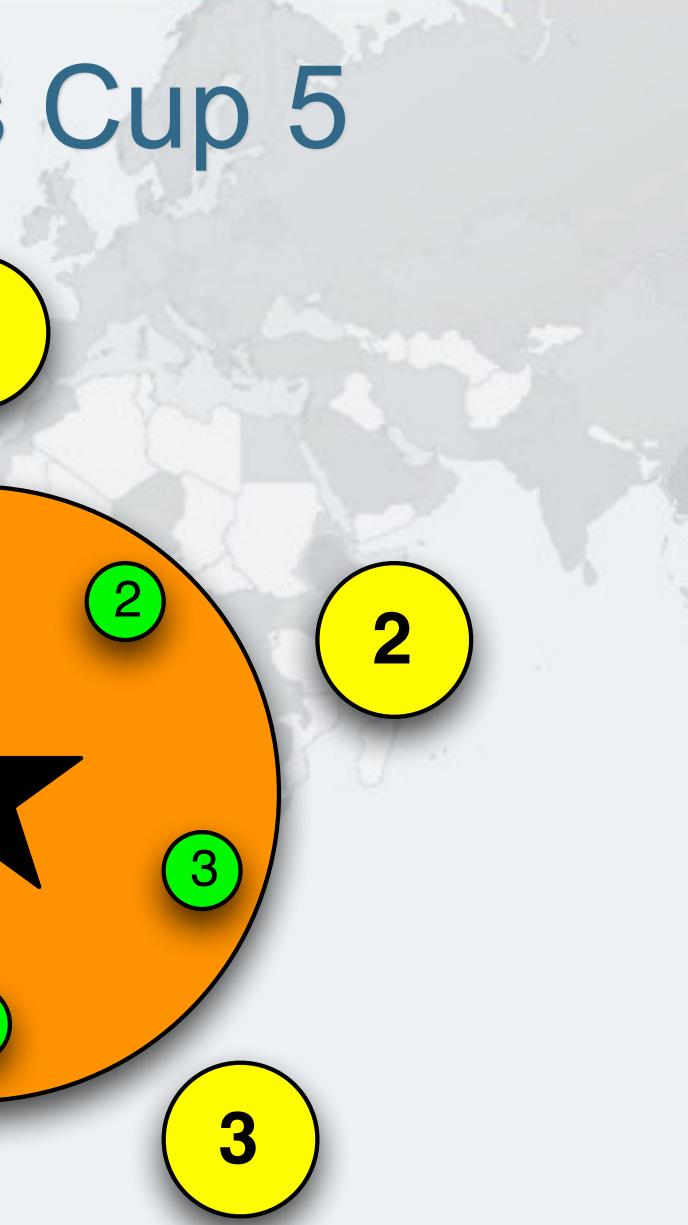

We start with all the philosophers thinking

Philosopher 5 Takes Cup 5

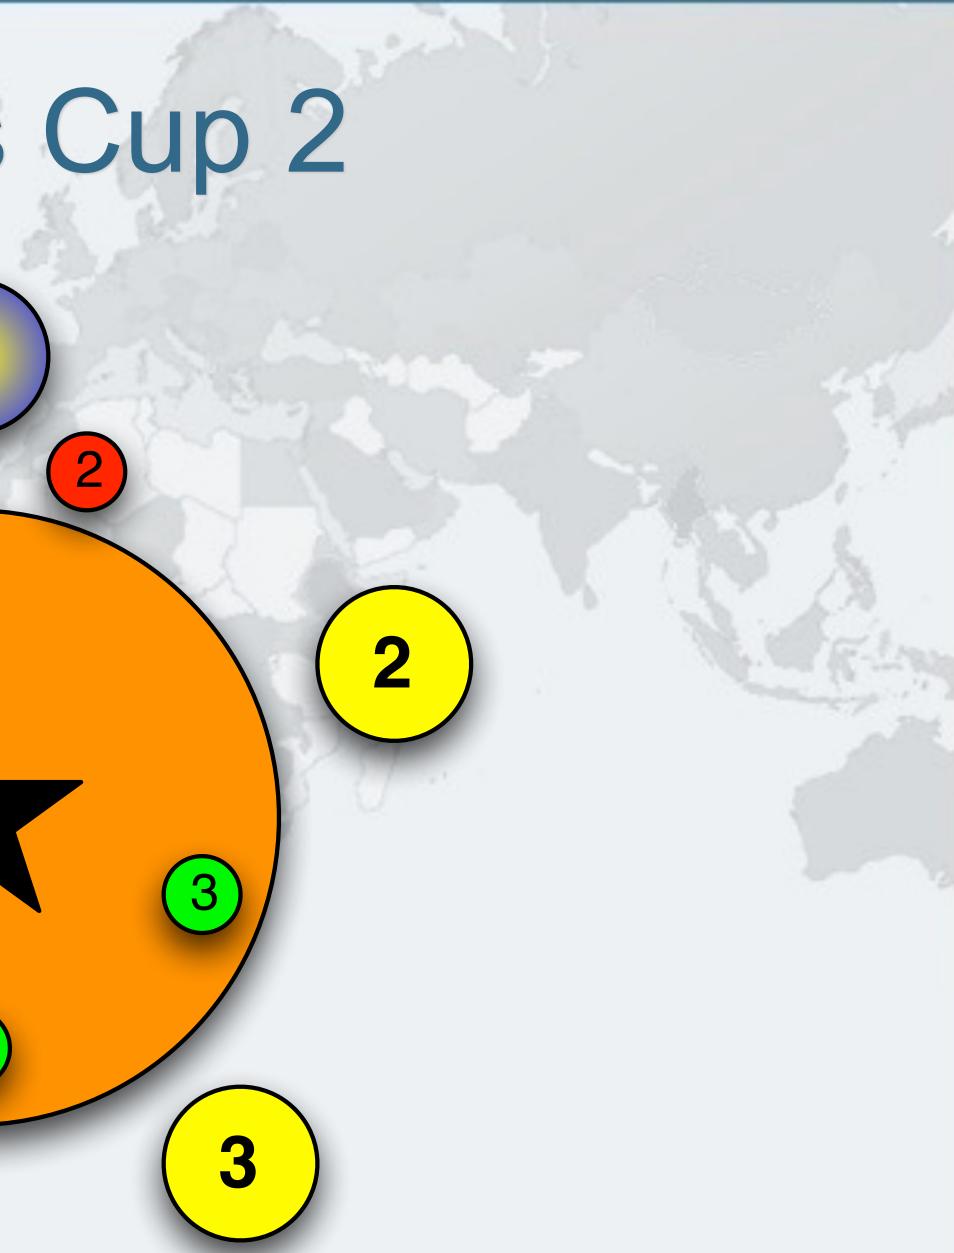

5

4

- Cup 5 has higher number
 - **Remember our rule!**

Philosopher 1 Takes Cup 2 • Must take the cup with the higher number first 5 – In this case cup 2 4

Philosopher 2 Takes Cup 3

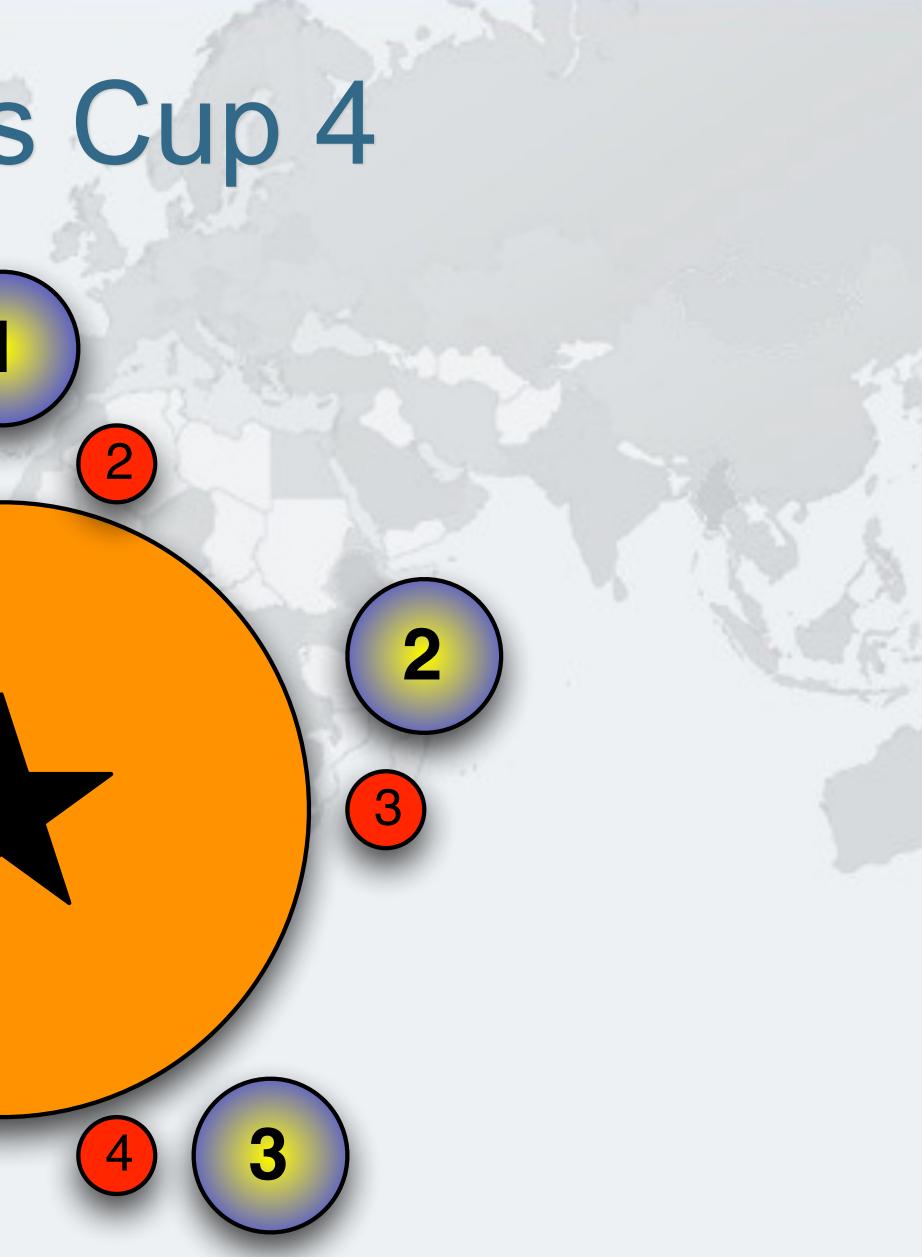

5

5

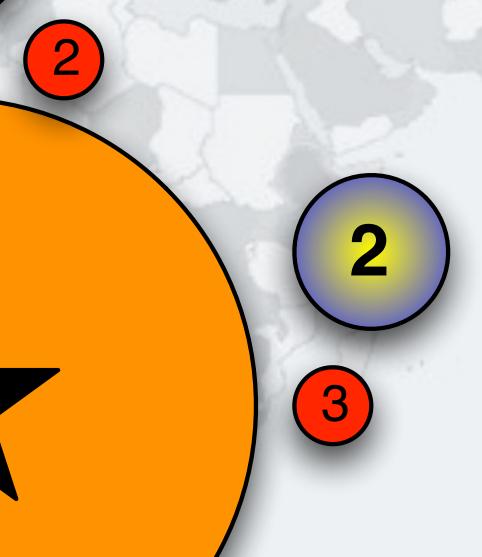

4

Philosopher 3 Takes Cup 4 Note that philosopher 4 is prevented from holding one cup 5

Philosopher 1 Takes Cup 1 - Drinking

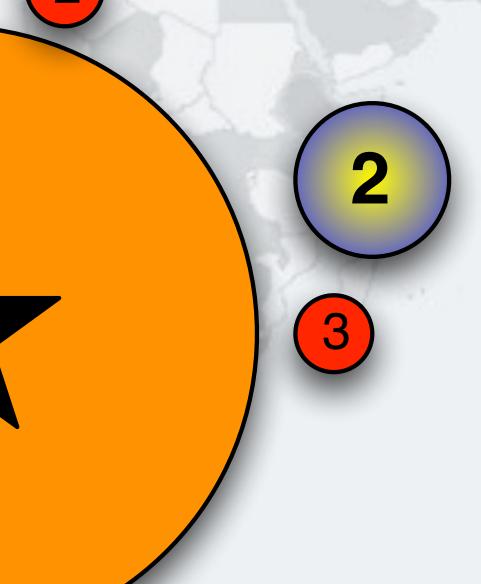

5

Philosopher 1 Returns Cup 1

4

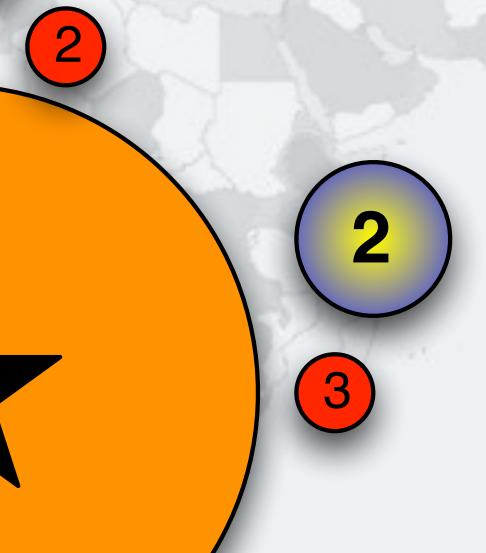

Cups are returned in the 1 opposite order to what they are acquired

Philosopher 5 Takes Cup 1 - Drinking

5

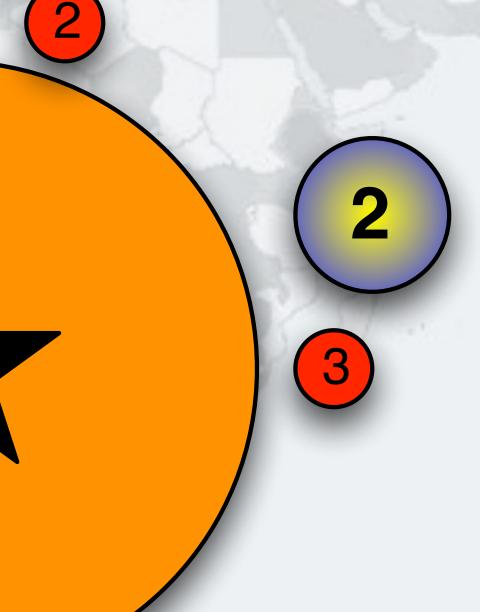

5

Philosopher 5 Returns Cup 1

5

5

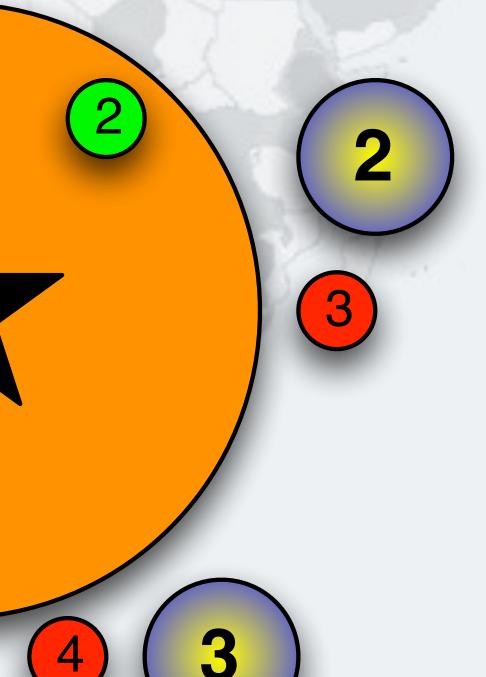

3

Philosopher 1 Returns Cup 2

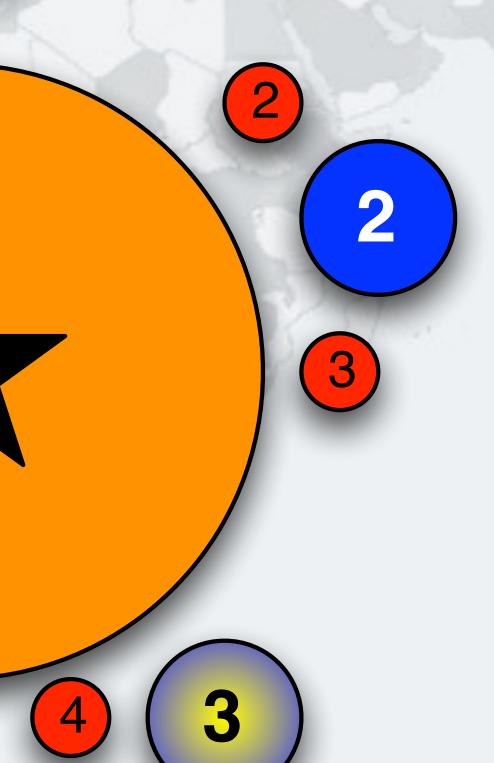

5

5

Philosopher 2 Takes Cup 2 - Drinking

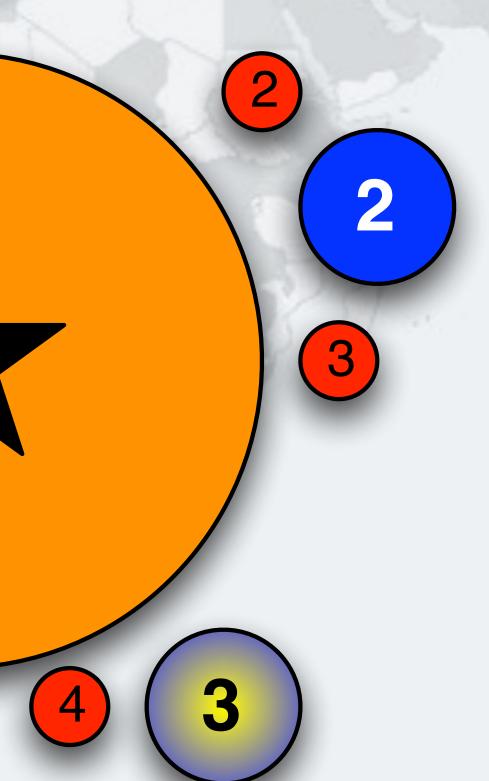

5

Philosopher 5 Returns Cup 5

5

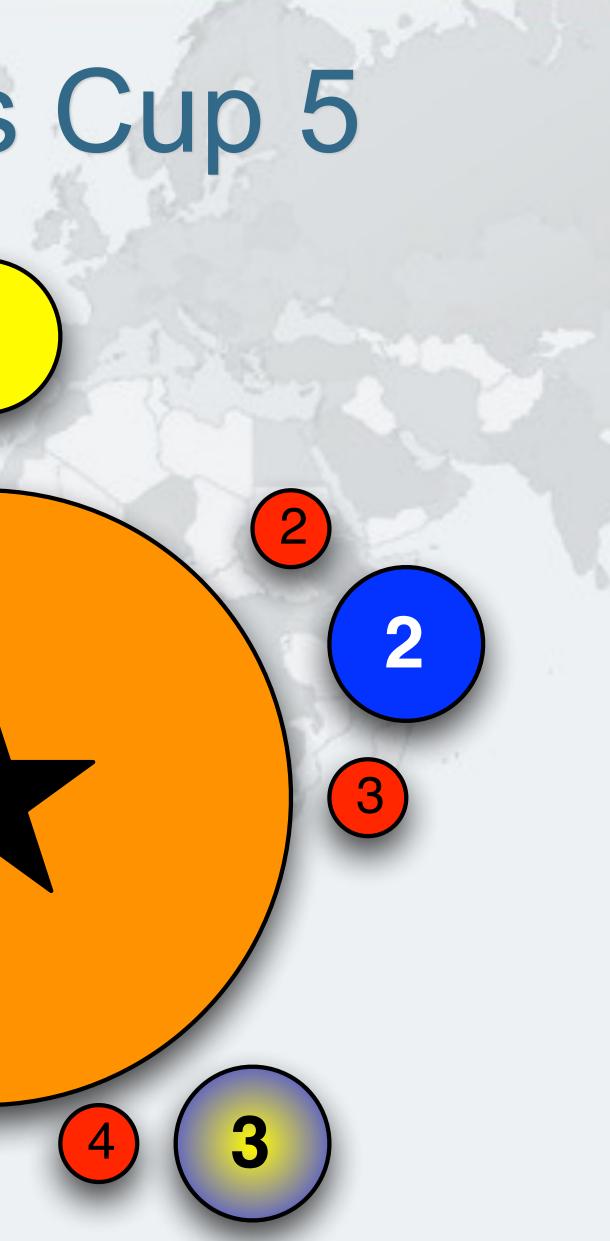

4

Philosopher 4 Takes Cup 5

5

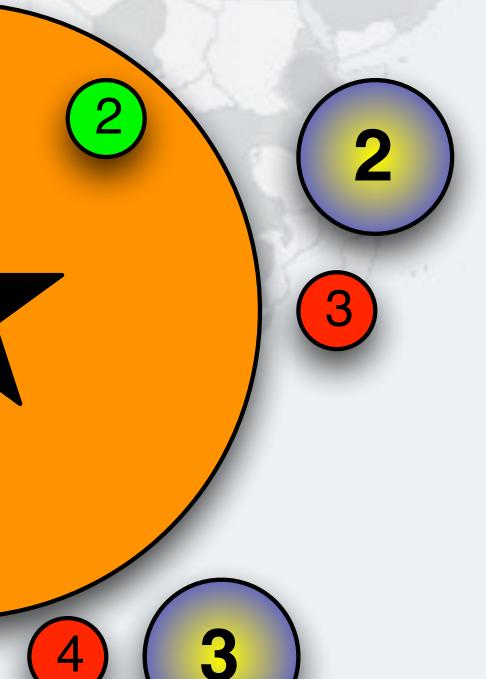

5

Philosopher 2 Returns Cup 2

5

5

Philosopher 2 Returns Cup 3

5

5

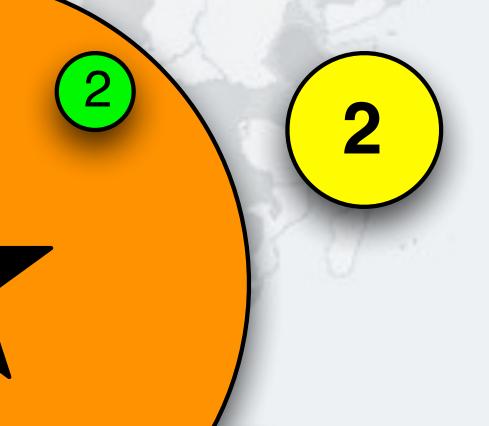

Philosopher 3 Takes Cup 3 - Drinking

5

5

4

3

Philosopher 3 Returns Cup 3

5

5

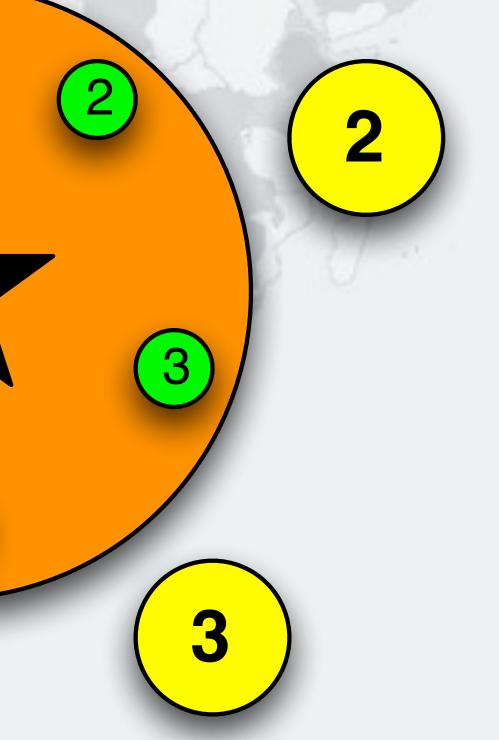

4

Philosopher 3 Returns Cup 4

5

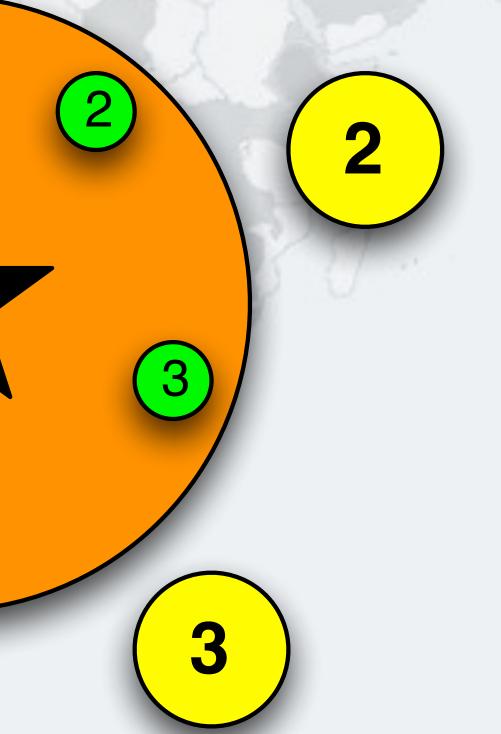

5

Philosopher 4 Takes Cup 4 - Drinking

5

5

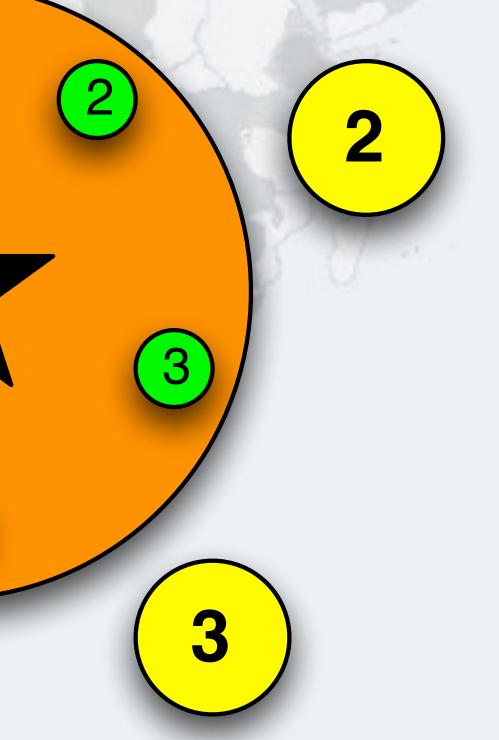

4

Philosopher 4 Returns Cup 4

5

5

5

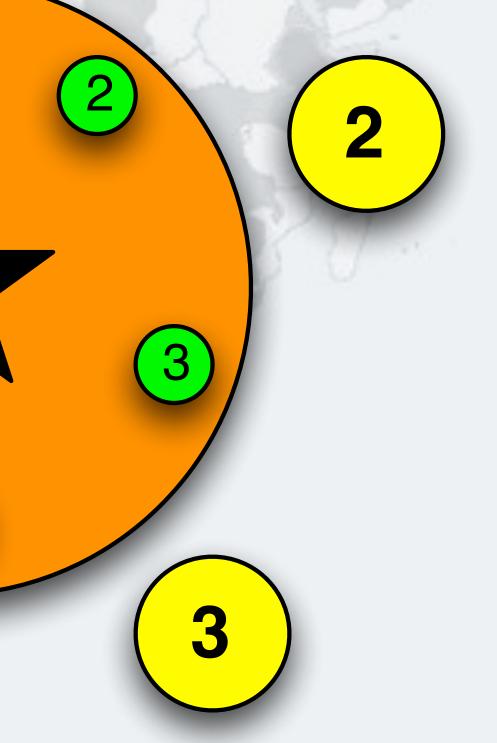

Philosopher 4 Returns Cup 5

5

4

4

Deadlock free!

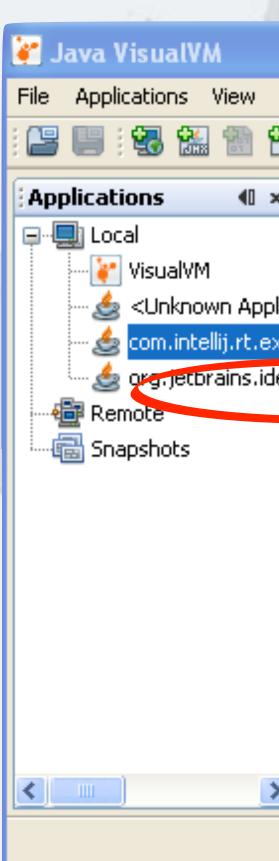

Deadlock Is Avoided

Impossible for all philosophers to hold one cup

Tools jstack and jps

- For the hardcode geek, we have command line tools
 - jps
 - shows your Java process ids
 - jstack pid
 - shows what your JVM is currently doing Tools are in your jdk/bin directory

Lab 1 Exercise

Lab1 Exercise lab1/readme.txt http://tinyurl.com/deadlocks2016

- In our first lab, a bunch of philosophers (Thinker) are sitting around a table at their symposium and are using two cups of wine (Krasi) to quench their thirst. Each of them first grabs the left and then the right cup. If they all grab the right cup at the same time, we will have some unhappy philosophers caught in limbo.
 - 1. To run the code you can either use the run.bat file or mvn -Prun. To compile you can use mvn install.
 - 2. Run the code and verify that you see a deadlock by capturing a stack trace. Depending on your machine, you might need a few runs to see the issue.
 - 3. Once you have discovered the deadlock, verify that it involves the left and right locks.
 - 4. Now define a global ordering for the locks. For example, you can either let Krasi implement Comparable and give it a number to sort by, or you can use System.identityHashCode() to be able to compare the cups. (Warning: Sadly, the identity hash code is not guaranteed to be unique. Thus you have to plan for this. It is easier to make Krasi comparable.)

5. Verify that the deadlock has now disappeared.

Good luck! You have 20 minutes to solve this lab.

\odot 2012-2016 Heinz Kabutz, All Rights Reserved

Lab1 Exercise Solution Explanation

Goal: Prevent all philosophers from holding a single cup

Lab1 Exercise Solution Explanation

Goal: Prevent all philosophers from holding a single cup

Thinker	Cup 1 right	Cup 2 left
1	1	2
2	2	3
3	3	4
4	4	5
5	5	1

The set of first cups is 2,3,4,5 – This means that at most four philosophers can hold a single cup!

Thinker	Cup 1	Cup 2
	big	small
1	2	1
2	3	2
3	4	3
4	5	4
5	5	1

Lab 2: Deadlock resolution by tryLock **Avoiding Liveness Hazards**

Lab 2: Deadlock Resolution By Trylock

- Same problem as in Lab 1
- But our solution will be different
- Instead of a global order on the locks
 - We lock the first lock
 - We then try to lock the second lock
 - If we can lock it, we start drinking
 - If we cannot, we back out completely and try again – What about starvation or livelock?

Lock And Reentrantlock

- The Lock interface offers different ways of locking: - Unconditional, polled, timed and interruptible public interface Lock { void lock(); void lockInterruptibly() throws InterruptedException; boolean tryLock(); **boolean** tryLock(long timeout, TimeUnit unit) throws InterruptedException; void unlock(); Condition newCondition();
- Lock implementations must have same memory-visibility semantics as intrinsic locks (synchronized)

Reentrantlock Implementation

- Like synchronized, it offers reentrant locking semantics
- Also, we can interrupt threads that are waiting for locks
 - Actually, the ReentrantLock never causes the thread to be **BLOCKED**, but always WAITING
 - If we try to acquire a lock unconditionally, interrupting the thread will simply go back into the WAITING state
- Once the lock has been granted, the thread interrupts itself

Using The Explicit Lock

- We have to call unlock() in a finally block
 - Every time, without exception
 - There are FindBugs detectors that will look for forgotten

"unlocks"

public void update() { try {

// update object state // catch exceptions and restore // invariants if necessary } finally {

lock.unlock();

private final Lock lock = new ReentrantLock(); lock.lock(); // this should be before try

Polled Lock Acquisition Instead of unconditional lock, we can tryLock() if (lock.tryLock()) { try { balance = balance + amount; } finally { lock.unlock(); } else { // alternative path

Using Try-Lock To Avoid Deadlocks

- Deadlocks happen when we lock multiple locks in different orders
- We can avoid this by using tryLock()
 - If we do not get lock, sleep for a random time and then try again
 - Must release all held locks, or our deadlocks become livelocks
- This is possible with synchronized, see my newsletter http://www.javaspecialists.eu/archive/lssue194.html

Using Trylock() To Avoid Deadlocks

```
public void drink() {
 while (true) {
    right.lock();
    try {
      if (left.tryLock()) {
        try {
          // now we can finally drink and then return
          return;
        } finally {
          left.unlock();
    } finally {
      right.unlock();
    LockSupport.parkNanos(System.nanoTime() & 0xffff);
```

Deadlock Is Prevented In This Design

Lab 2 Exercise

Deadlock resolution by tryLock

Lab2 Exercise lab2/readme.txt http://tinyurl.com/deadlocks2016

- Run Main class to trigger deadlock
 - You might need a few runs
- Capture a stack trace with JVisualVM
- Verify the deadlock involves the left and right locks
- Use Lock.tryLock() to avoid blocking on the inner lock (forever)
 - lock the right
 - tryLock the left
 - if success, then drink and unlock both
 - otherwise, unlock right and retry
 - Change the Thinker.java file
- Verify that the deadlock has now disappeared ____

Lab2 Exercise Solution Explanation

- Goal: Prevent all philosophers from forever blocking on the second cup
 - A philosopher should not die of thirst
 - We need to avoid livelocks
 - lock/tryLock vs. tryLock/tryLock

Lab 3: Resource Deaclock **Avoiding Liveness Hazards**

Lab 3: Resource Deadlock

- Problem: threads are blocked waiting for a finite resource that never becomes available
- Examples:
 - Resources not being released after use
 - Running out of threads
 - Java Semaphores not being released
 - JDBC transactions getting stuck
 - Bounded queues or thread pools getting jammed up

Challenge Does not show up as a Java thread deadlock Problem thread could be in any state: RUNNABLE, WAITING, BLOCKED, TIMED_WAITING

How To Solve Resource Deadlocks

- Approach: If you can reproduce the resource deadlock Take a thread snapshot shortly before the deadlock

 - Take another snapshot after the deadlock
 - Compare the two snapshots
- Approach: If you are already deadlocked
 - Take a few thread snapshots and look for threads that do not move
- It is useful to identify the resource that is being exhausted
 - A good trick is via phantom references (beyond scope of this lab) ____

Resource Deadlocks

- We can also cause deadlocks waiting for resources
- For example, say you have two DB connection pools
 - Some tasks might require connections to both databases
 - Thus thread A might hold semaphore for D1 and wait for D2, whereas thread B might hold semaphore for D2 and be waiting for D1
- Thread dump and ThreadMXBean does not show this as a deadlock!

Our Databasepool - Connect() And Disconnect()

public class DatabasePool { private final Semaphore connections; public DatabasePool(int connections) { this.connections = new Semaphore(connections);

public void connect() { connections.acquireUninterruptibly(); System.out.println("DatabasePool.connect");

public void disconnect() { System.out.println("DatabasePool.disconnect"); connections.release();

Threadmxbean Does Not Detect This Deadlock DatabasePool.connect DatabasePool.connect

		Memory Monitor 72896K allocated 11248K used Performance Areas 1 ms ClipAnim 32.0 fps Intersection 31.9 fps Text 6 ms

Lab3 Exercise Solution Explanation

Goal: Ensure that resources are released after use Diff between the two thread dumps using jps and jstack

< at java.util.concurrent.locks.AbstractQueuedSynchronizer\$ConditionObject.await(AbstractQueuedSynchronizer.java:2043) < at java.awt.EventQueue.getNextEvent(EventQueue.java:531) < at java.awt.EventDispatchThread.pumpOneEventForFilters(EventDispatchThread.java:213) ---

> at java.util.concurrent.locks.AbstractQueuedSynchronizer.parkAndCheckInterrupt(AbstractQueuedSynchronizer.java:834)
 > at java.util.concurrent.locks.AbstractQueuedSynchronizer.doAcquireSharedInterruptibly(AbstractQueuedSynchronizer.java:994)
 > at java.util.concurrent.locks.AbstractQueuedSynchronizer.acquireSharedInterruptibly(AbstractQueuedSynchronizer.java:1303)
 > at java.util.concurrent.Semaphore.acquire(Semaphore.java:317)
 > at eu.javaspecialists.deadlock.lab3.java2d.MemoryManager.gc(MemoryManager.java:153)
 > at eu.javaspecialists.deadlock.lab3.java2d.MemoryMonitor\$Surface.paint(MemoryMonitor.java:153)

Fault is probably in our classes, rather than JDK

What Is Wrong With This Code?

```
/**
 * Only allow a maximum of 30 threads to call System.gc() at a time.
 */
public class MemoryManager extends Semaphore {
  private static final int MAXIMUM_NUMBER_OF_CONCURRENT_GC_CALLS = 30;
  public MemoryManager() {
    super(MAXIMUM_NUMBER_OF_CONCURRENT_GC_CALLS);
  public void gc() {
    try {
      acquire();
      try {
        System.gc();
      } finally {
        System.out.println("System.gc() called");
        release();
    } catch (Exception ex) {
      // ignore the InterruptedException
```

Calling System.gc() is baddd (but not **the** problem)

Empty catch block hides problem

Lab 4: Combining Your SKIIS

Avoiding Liveness Hazards

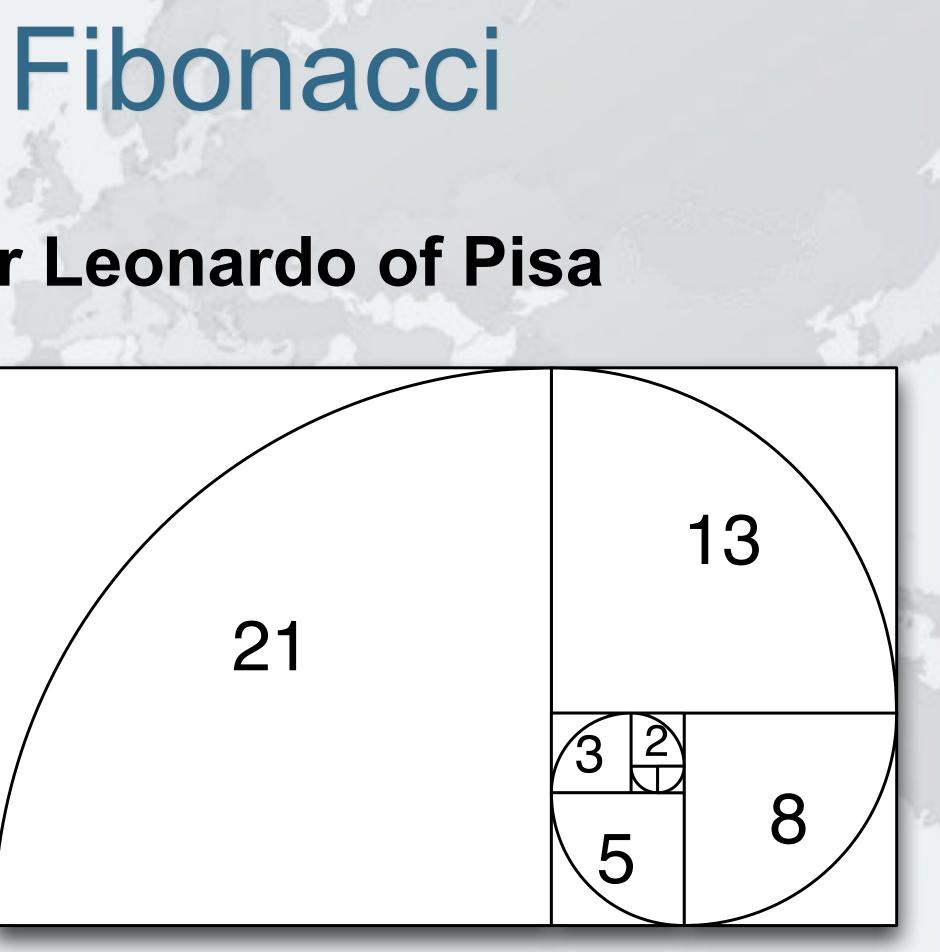

Lab 4: Combining Your Skills Problem: try to solve lab 4 using the skills learned Be careful - it is not as easy as it looks :-) http://tinyurl.com/deadlocks2016

Lab 5: Speeding Up Fibonacci

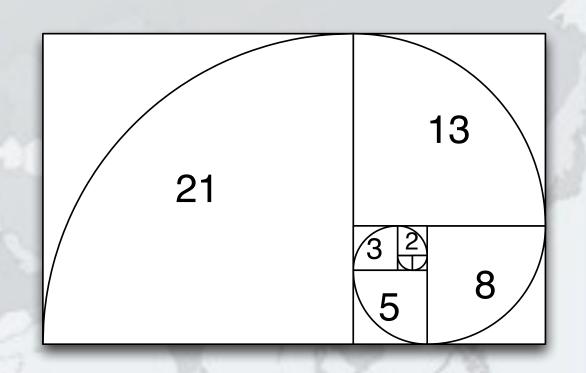

Lab 5: Speeding Up Fibonacci

- Number sequence named after Leonardo of Pisa
 - F0 = 0
 - F1 = 1
 - Fn = Fn-1 + Fn-2
- Thus the next number is equal to the sum of the two previous numbers
 - e.g. 0, 1, 1, 2, 3, 5, 8, 13, 21, ...
- The numbers get large very quickly

First Attempt At Writing A Fibonacci Method

- Taking our recursive definition
 - $-F_0 = 0, F_1 = 1$
 - $-F_n = F_{n-1} + F_{n-2}$
- Our first attempt writes a basic recursive function public long f(int n) { if (n <= 1) return n;</pre> **return** f(n-1) + f(n-2);}
- But this has exponential time complexity
- f(n+10) is 1000 slower than f(n)

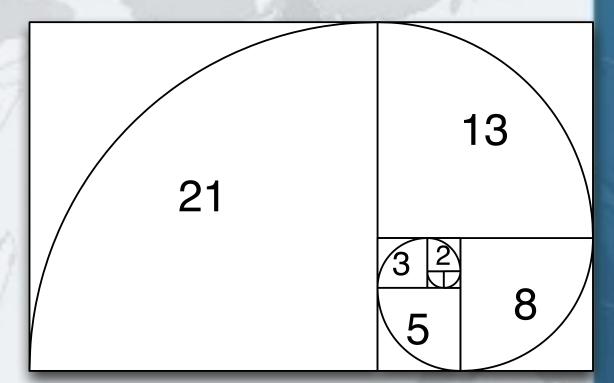

2nd Attempt at Coding Fibonacci

Instead of a recursive method, we use iteration: public static long f(int n) { long n0 = 0, n1 = 1; for (int i = 0; i < n; i++) {</pre> **long** temp = n1;n1 = n1 + n0;n0 = temp;return n0;

This algorithm has linear time complexity

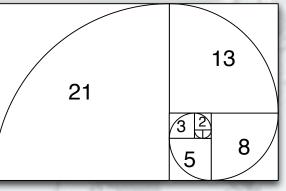

- Solved f(1_000_000_000) in 1.7 seconds
 - However, the numbers overflow so the result is incorrect
 - We can use BigInteger, but its add() is also linear, so time is quadratic
 - We need a better algorithm

3rd Attempt Dijkstra's Sum of Squares

- Dijkstra noted the following formula for Fibonacci
 - $-F_{2n-1} = F_{n-1}^2 + F_n^2$
 - $-F_{2n} = (2 \times F_{n-1} + F_n) \times F_n$
- Logarithmic time complexity and can be parallelized Java 8 uses better BigInteger multiply() algorithms
- Karatsuba complexity is O(n^{1.585})
 - 3-way Toom Cook complexity is O(n^{1.465})
 - Previous versions of Java had complexity O(n²)
 - Unfortunately multiply() in BigInteger is only available single-threaded - we'll fix that in Lab 5.3

Lab 5.1: Dijkstra's Sum Of Squares

- Implement this algorithm using BigInteger
 - $F_{2n-1} = F_{n-1}^2 + F_n^2$
 - $F_{2n} = (2 \times F_{n-1} + F_n) \times F_n$
- Run all tests in FibonacciTest and record the times Do it yourself - no cheating with Google!

Lab 5.2: Parallelize Your Algorithm

We can parallelize by using common Fork/Join Pool private final class FibonacciTask extends RecursiveTask<BigInteger> {

private final int n; private FibonacciTask(int n) { this.n = n;

protected BigInteger compute() { return f(n);

Next we fork() the 1st task, do the ^{2nd} and then join 1st

FibonacciTask fn_1Task = new FibonacciTask(n - 1); fn_1Task.fork(); BigInteger fn = f(n);BigInteger fn_1 = fn_1Task.join();

}

Lab 5.3: Parallelize Biginteger

- Using principles from lab 5.2, parallelize methods in eu.javaspecialists.performance.math.BigInteger
 - multiplyKaratsuba()
 - multiplyToomCook3()
 - squareKaratsuba()
 - squareToomCook3()

- Lab 5.4: Cache Results Dijkstra's Sum of Squares needs to work out some values several times. Cache results to avoid this. • Make sure you implement a "reserved caching scheme" where if one thread says he wants to calculate some value, others would wait – e.g. have a special BigInteger that signifies RESERVED
 - First thing a task would do is check if map contains that
 - If it doesn't, it puts it in and thus reserves it
 - If it does, it waits until the task is done and uses that value

Lab 5.5: ManagedBlocker

- ForkJoinPool is configured with desired parallelism
 - Number of active threads
 - ForkJoinPool mostly used with CPU intensive tasks
- If one of the FJ Threads has to block, a new thread
 - can be started to take its place
 - This is done with the ManagedBlocker
- Change your cache to use ManagedBlocker to keep parallelism high

Wrap Up

Avoiding Liveness Hazards

Conclusion On Deadlocks

- Concurrency is difficult, but there are tools and techniques that we can use to solve problems
- These are just a few that we use
- For more information, have a look at
 - The Java Specialists' Newsletter
 - http://www.javaspecialists.eu
- Made in Chania (mostly)

Finding and Solving Java Deadlocks Dr Heinz M. Kabutz heinz@kabutz.net @heinzkabutz
